

# Logistics operations performance review

Freight, service, fleet and safety across 85,410 loads, January 2022 to December 2024

Revenue

**\$298.6M**

85,410 loads

Revenue per mile

**\$2.44**

122M miles

On-time delivery

**44.6%**

Pickups 67%

Fuel cost, est.

**\$73.9M**

24.7% of revenue

Revenue by month

Linehaul, fuel surcharge and accessorials

Revenue was flat at **\$99.9M**, **\$98.9M** and **\$99.8M** across the three years. Volume is steady apart from a shorter February.

Key findings

Across all three years

45%

of deliveries arrive on time. The rate is unchanged in three years and identical across facilities and customer types.

49.8K h

of detention beyond 2 free hours, while accessorials average only \$72 a load.

\$1.70

per mile on the lowest-paying lane. Fuel costs the same everywhere, so rate decides lane quality.

+29%

more fuel bought than burned. Purchases don't track trip distance and need an audit.

33%

of maintenance visits are emergencies, on a fleet where 65% of trucks are 2015 models.

16%

of revenue came from accounts now inactive. Churn deserves a follow-up.

# Year by year

How the main measures moved between 2022 and 2024

| Annual summary                    |          |          |          |        |
|-----------------------------------|----------|----------|----------|--------|
| Change is 2024 compared with 2022 |          |          |          |        |
| Measure                           | 2022     | 2023     | 2024     | Change |
| Revenue                           | \$99.9M  | \$98.9M  | \$99.8M  | -0.1%  |

| Lane                  | Miles | Revenue / mile     | Net after fuel |
|-----------------------|-------|--------------------|----------------|
| Charlotte → Denver    | 1,559 | \$1.70 <div></div> | \$2.64M        |
| Las Vegas → New York  | 2,561 | \$1.71 <div></div> | \$4.32M        |
| Miami → Seattle       | 3,141 | \$1.80 <div></div> | \$5.61M        |
| Atlanta → Chicago     | 677   | \$1.95 <div></div> | \$1.36M        |
| Phoenix → Denver      | 673   | \$1.96 <div></div> | \$1.37M        |
| Las Vegas → Dallas    | 1,229 | \$1.97 <div></div> | \$2.49M        |
| Miami → Denver        | 1,984 | \$1.97 <div></div> | \$4.03M        |
| Memphis → Minneapolis | 804   | \$1.99 <div></div> | \$1.71M        |
| New York → Columbus   | 547   | \$2.00 <div></div> | \$1.18M        |
| Chicago → Portland    | 2,017 | \$2.01 <div></div> | \$4.25M        |

Best-paying lanes

Capacity worth protecting

| Lane                    | Miles | Revenue / mile     | Net after fuel |
|-------------------------|-------|--------------------|----------------|
| Philadelphia → New York | 92    | \$3.62 <div></div> | \$436K         |
| Las Vegas → Los Angeles | 262   | \$3.13 <div></div> | \$1.04M        |
| Portland → Seattle      | 167   | \$3.02 <div></div> | \$617K         |
| Columbus → Portland     | 2,332 | \$2.98 <div></div> | \$8.70M        |
| Charlotte → Portland    | 2,627 | \$2.94 <div></div> | \$8.92M        |
| Minneapolis → Houston   | 1,216 | \$2.94 <div></div> | \$4.17M        |
| Las Vegas → Kansas City | 1,311 | \$2.91 <div></div> | \$4.44M        |
| Columbus → Los Angeles  | 2,269 | \$2.90 <div></div> | \$8.21M        |
| Phoenix → Philadelphia  | 2,389 | \$2.84 <div></div> | \$8.30M        |
| Columbus → Minneapolis  | 720   | \$2.84 <div></div> | \$2.42M        |

Fuel costs about **\$0.60 a mile** on every lane, so the rate charged is what separates a good lane from a poor one. Long cross-country lanes paying under \$1.85 a mile leave little room for driver pay, insurance and overhead. Net is revenue left after estimated fuel.

## Fleet

Truck age, maintenance and downtime

Fleet size

**120**

92 active, 28 out of service

Maintenance spend

**\$5.73M**

Parts are 78% of cost

Downtime

**72,231 h**

From service visits

Emergency repairs

**33%**

971 visits, \$1.91M

### Trucks by model year

120 trucks in the fleet

65% of the fleet are 2015 models. Only 20 trucks are from 2018 or later.

### Maintenance spend by type

2,920 service visits

Spend is spread evenly across service types, so no single system is failing. The issue is timing: 33% of visits were unplanned.

## Safety

Incidents, claims and preventability

Incidents

170

1.39 per million miles

Claims

\$2.65M

Vehicle and cargo damage

Preventable

38%

Of all incidents

Preventable cost

\$904K

Avoidable with better practice

Claims by incident type

170 incidents, all years

Preventable

Not preventable

| Incident Type      | Preventable (\$K) | Not preventable (\$K) |
|--------------------|-------------------|-----------------------|
| Equipment Damage   | 190               | 540                   |
| DOT Violation      | 270               | 310                   |
| Accident           | 190               | 290                   |
| Customer Complaint | 160               | 260                   |
| Moving Violation   | 150               | 250                   |

Equipment damage costs the most. DOT violations have the highest preventable share, pointing to hours-of-service and inspection compliance.

Drivers with repeat incidents

All years. Worth a coaching conversation, not a verdict.

| Driver            | Trips | Incidents | Preventable | Claims |
|-------------------|-------|-----------|-------------|--------|
| David Miller      | 660   | 7         | 3           | \$118K |
| Charles Hernandez | 677   | 6         | 2           | \$49K  |
| Robert Moore      | 608   | 3         | 2           | \$105K |
| Jennifer Martinez | 696   | 3         | 0           | \$82K  |
| John Davis        | 664   | 3         | 2           | \$62K  |
| Sarah Anderson    | 684   | 3         | 3           | \$61K  |

### Revenue by contract type

All years

Dedicated, contract and spot customers all get the same on-time rate. Committed customers see no better service.

# Recommendations

Ordered by likely impact

|   |                                                                                                                                                                                                                                                                           |           |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| 1 | <b>Rebuild delivery appointment scheduling</b><br>Set appointment windows from actual transit times plus realistic dock waits, then track on-time by lane each week. The failure rate is the same everywhere, so this is a planning problem rather than a driver problem. | Service   |
| 2 | <b>Enforce and bill detention</b><br>Capture arrival and departure times automatically and invoice waits beyond 2 hours. Roughly 49,800 hours went unbilled, and charging for them also discourages the delays.                                                           | Revenue   |
| 3 | <b>Reprice the lowest-paying lanes</b><br>Renegotiate lanes under about \$1.85 a mile at contract renewal, starting with Charlotte to Denver, Las Vegas to New York and Miami to Seattle. Otherwise, shift capacity toward better-paying freight.                         | Margin    |
| 4 | <b>Audit fuel card spending</b><br>Match each transaction to a truck, trip and location. Flag purchases beyond tank capacity or off-route, since 29% more fuel was bought than burned.                                                                                    | Cost      |
| 5 | <b>Move maintenance from reactive to planned</b><br>Tighten preventive intervals on the 2015 trucks and plan replacements for the units with the most downtime, since a third of service visits are emergencies.                                                          | Uptime    |
| 6 | <b>Target preventable incidents</b><br>Strengthen pre-trip inspections and hours-of-service compliance, and coach drivers with repeat incidents. About \$0.9M in claims were preventable.                                                                                 | Safety    |
| 7 | <b>Follow up with lost accounts</b><br>Find out why the inactive accounts left. They made up 16% of revenue, and poor on-time delivery is a likely cause.                                                                                                                 | Retention |

## Data notes and method

Quality issues found while cleaning and joining the tables, and how figures were calculated

### Data quality issues

#### Fuel purchases don't match consumption

Cards bought 24.5M gallons against 18.9M burned. Purchases show no link to trip distance (correlation  $\approx 0$ ), and 201 are dated 2025, after the last load.

#### Missing trip assignments

1,714 trips have no driver and 1,672 have no truck, about 2% of trips. They are excluded from driver and truck views.

#### Impossible utilization rates

436 of 3,312 truck-month records exceed 100%. The monthly utilization table is not used for conclusions.

#### Duplicate customer names

There are 200 account IDs but only 107 distinct names, so accounts are reported by ID.

#### Invalid locations

Some fuel purchases pair a city with the wrong state (for example New York, AZ).

#### Little variation between drivers

On-time rate, fuel economy and idle time barely differ between drivers, so driver rankings on those measures are left out.

### Method

#### Revenue

Linehaul revenue plus fuel surcharge plus accessorial charges, taken from the loads table.

#### Fuel cost

Gallons burned per trip multiplied by that month's average price per gallon. Fuel purchases are not used for cost because of the mismatch described alongside.

#### On time

A delivery counts as on time within 2 hours either side of its scheduled time, following the on\_time\_flag field.

#### Net after fuel

Revenue minus estimated fuel. The data has no driver pay, insurance or overhead, so this is a contribution figure, not profit.

#### Detention

Waiting beyond a standard 2-hour free window, summed across pickup and delivery stops.

#### Joins

Trips are joined to loads, routes and customers by ID. Delivery events are matched to trips as one pickup and one delivery per trip.

## Appendix: lane economics

All 58 lanes, sorted from lowest to highest revenue per mile (1 of 2)

| Lane                        | Loads | Miles | Revenue / mile                | Fuel / mile | Net after fuel |
